SAP BTP's Journey Towards Openness

Building on an Open, Cloud-Native Platform

The Evolution of SAP BTP

SAP BTP Environments

Cloud Foundry

General-purpose runtime environment for custom extension apps built using Java, Node.js, Python, .NET, and so forth. Also used to host Fiori/HTML5 apps.

Kyma

The Kyma environment is used to build microservices and extensions using a Kubernetes-based serverless runtime. Its connector framework supports integration with both SAP and non-SAP systems.

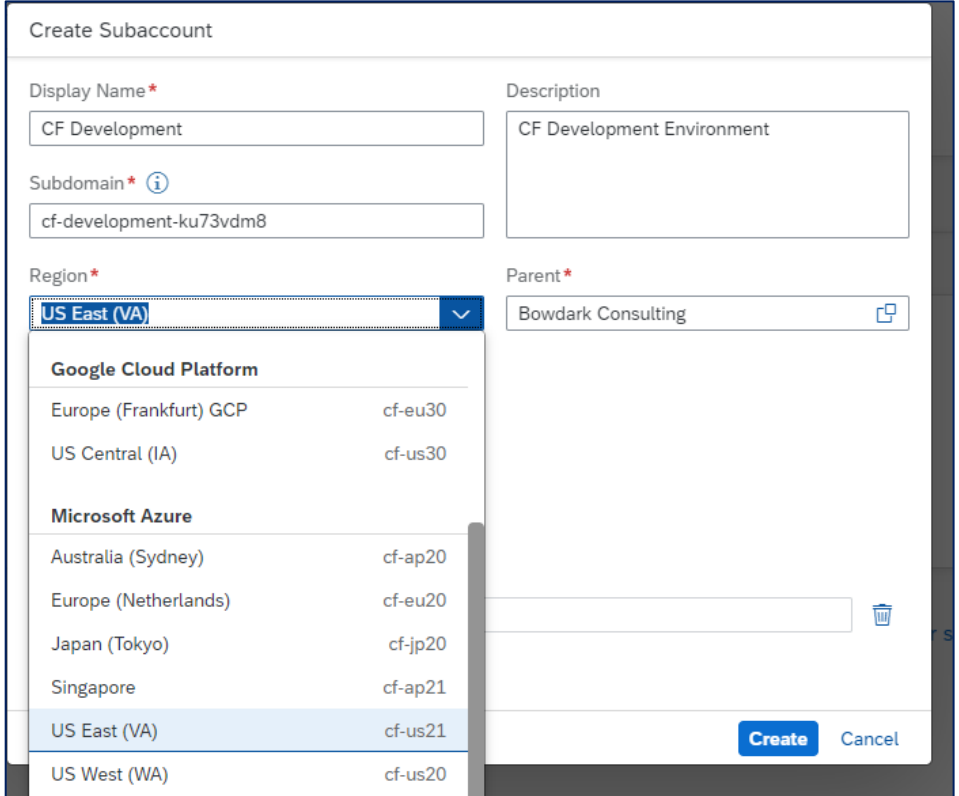

ABAP Environment

This environment can be used to develop extensions using the ABAP programming language. This environment is limited compared to a traditional on-premises ABAP environment.

BTP Deployment Options

- Whenever a BTP subaccount is created, customers can choose the target hyperscaler/region
- Although the environment is managed by SAP, it is close to other cloud-based resources hosted on that hyperscaler within the region

Create Subaccount

Display Name*
